Achieving the ultimate performance with KVM

Venko Moyankov
at European Cloud Infrastructure & CloudStack User Day
London, 2019-10

Why performance

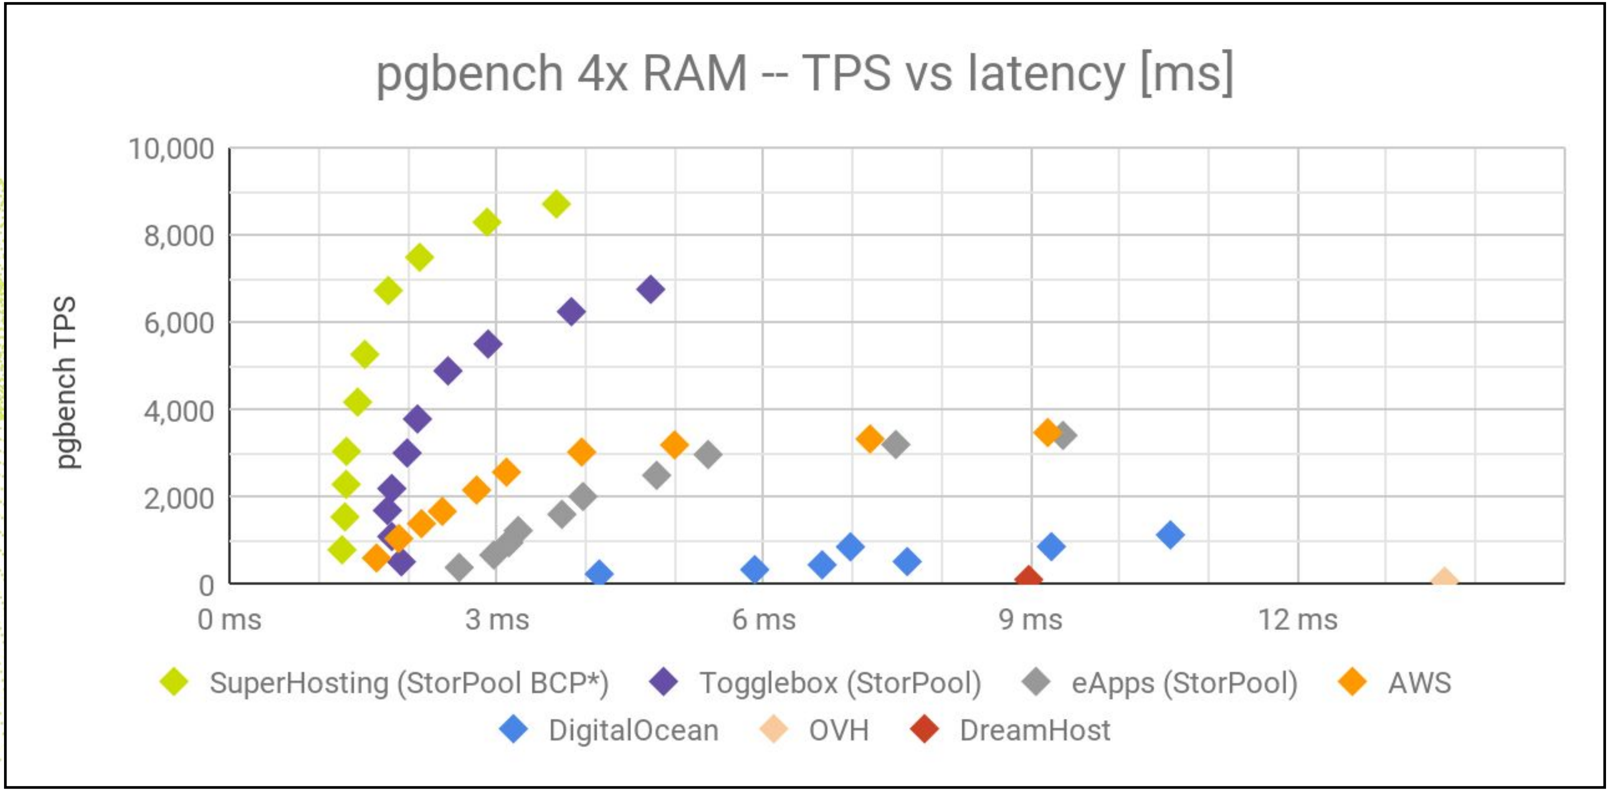
- Better application performance -- e.g. time to load a page, time to rebuild, time to execute specific query

- Happier customers (in cloud / multi-tenant environments)

- ROI, TCO - Lower cost per delivered resource (per VM) through higher density

StorPool
DISTRIBUTED STORAGE

Why performance



Agenda

- Hardware
- Compute - CPU & Memory
- Networking
- Storage

StorPool
DISTRIBUTED STORAGE

Compute node hardware

Usual optimization goal
- lowest cost per delivered resource
- fixed performance target
- calculate all costs - power, cooling, space, server, network, support/maintenance

Example: cost per VM with 4x dedicated 3 GHz cores and 16 GB RAM

Unusual
- Best single-thread performance I can get at any cost
- 5 GHz cores, yummy :)

Compute node hardware

	Brand	Model	release date	ark.intel.com status	release price ($)	Cores	TDP (W)	All-Core Turbo Clock (GHz)	Selected 1S or 2S or 4S ?	Total $ per core	Total $/GHz
2	Gold	6222V	May 2019	Launched	$1,600	20	115	2.4	2S	$290	$121
3	Silver	4216	April 2019	Launched	$1,002	16	100	2.7	2S	$296	$110

StorPool DISTRIBUTED STORAGE

Compute node hardware

Intel

lowest cost per core:

- Xeon Gold 6222V - 20 cores @ 2.4 GHz

lowest cost per 3GHz+ core:

- Xeon Gold 6210U - 20 cores @ 3.2 GHz
- Xeon Gold 6240 - 18 cores @ 3.3 GHz
- Xeon Gold 6248 - 20 cores @ 3.2 GHz

AMD

- EPYC 7702P - 64 cores @ 2.0/3.35 GHz - lowest cost per core
- EPYC 7402P - 24 cores / 1S - low density
- EPYC 7742 - 64 cores @ 2.2/3.4GHz x 2S - max density

StorPool DISTRIBUTED STORAGE

Compute node hardware

Form factor

from

to

Compute node hardware

- firmware versions and BIOS settings
- Understand power management -- esp. C-states, P-states, HWP and “bias”
    - Different on AMD EPYC: "power-deterministic", "performance-deterministic"
- Think of rack level optimization - how do we get the lowest total cost per delivered resource?

Tuning KVM

RHEL7 Virtualization_Tuning_and_Optimization_Guide link

https://pve.proxmox.com/wiki/Performance_Tweaks

https://events.static.linuxfound.org/sites/events/files/slides/CloudOpen2013_Khoa_Huynh_v3.pdf

http://www.linux-kvm.org/images/f/f9/2012-forum-virtio-blk-performance-improvement.pdf

http://www.slideshare.net/janghoonsim/kvm-performance-optimization-for-ubuntu

… but don't trust everything you read. Perform your own benchmarking!

StorPool DISTRIBUTED STORAGE

CPU and Memory

Recent Linux kernel, KVM and QEMU
… but beware of the bleeding edge
E.g. qemu-kvm-ev from RHEV (repackaged by CentOS)

tuned-adm virtual-host
tuned-adm virtual-guest

CPU

Typical

- (heavy) oversubscription, because VMs are mostly idling
- HT
- NUMA
- route IRQs of network and storage adapters to a core on the NUMA node they are on

Unusual

- CPU Pinning

StorPool
DISTRIBUTED STORAGE

Understanding oversubscription and congestion

Linux scheduler statistics: linux-stable/Documentation/scheduler/sched-stats.txt

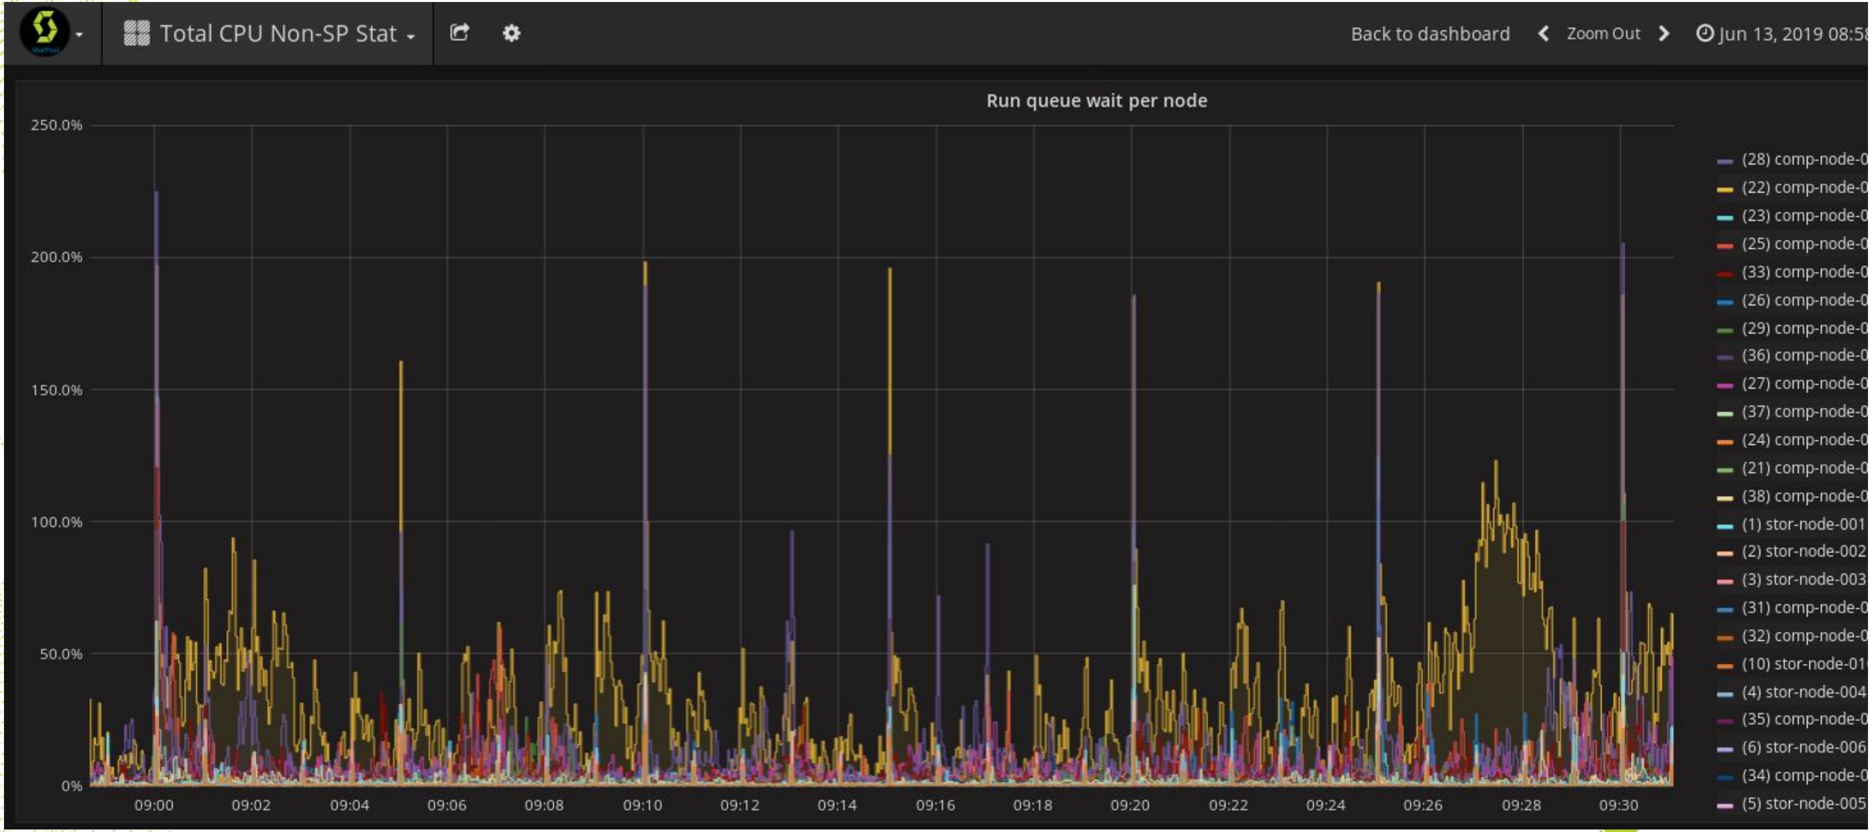
```
Next three are statistics describing scheduling latency:
     7) sum of all time spent running by tasks on this processor (in jiffies)
     8) sum of all time spent waiting to run by tasks on this processor (in jiffies)
     9) # of timeslices run on this cpu
```

20% CPU load with large wait time (bursty congestion) is possible
100% CPU load with no wait time, also possible

Measure CPU congestion!

StorPool DISTRIBUTED STORAGE

Understanding oversubscription and congestion



StorPool
DISTRIBUTED STORAGE

Memory

Typical

- Dedicated RAM
- huge pages, THP
- NUMA
- use local-node memory if you can

Unusual

- Oversubscribed RAM
- balloon
- KSM (RAM dedup)

StorPool
DISTRIBUTED STORAGE

Agenda

- Hardware
- Compute - CPU & Memory
- Networking
- Storage

StorPool
DISTRIBUTED STORAGE

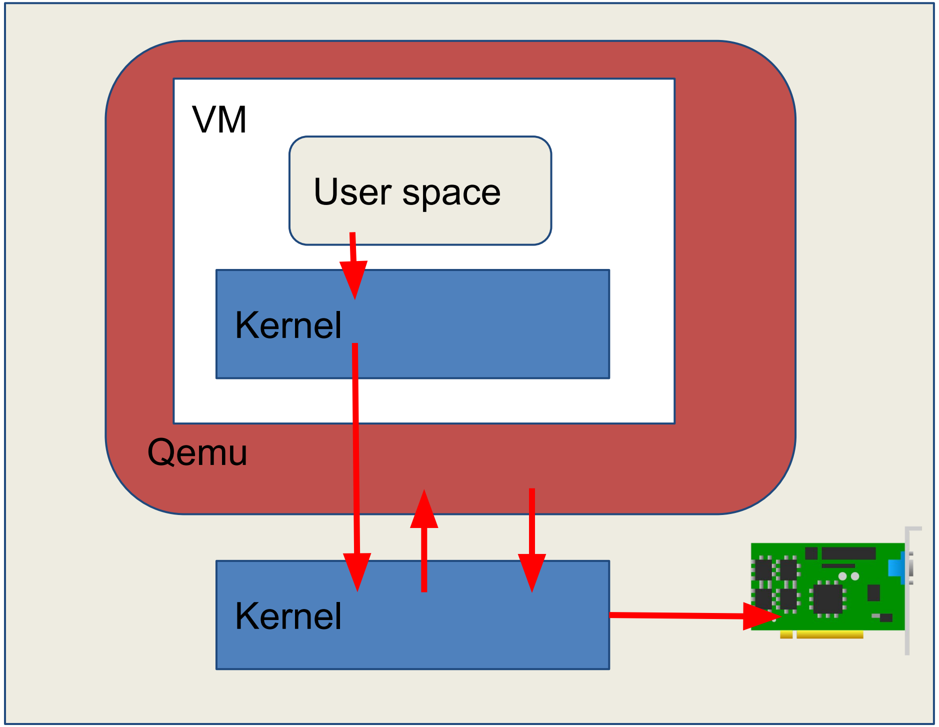
Networking

Virtualized networking
Use virtio-net driver
regular virtio vs vhost_net

Linux Bridge vs OVS in-kernel vs OVS-DPDK

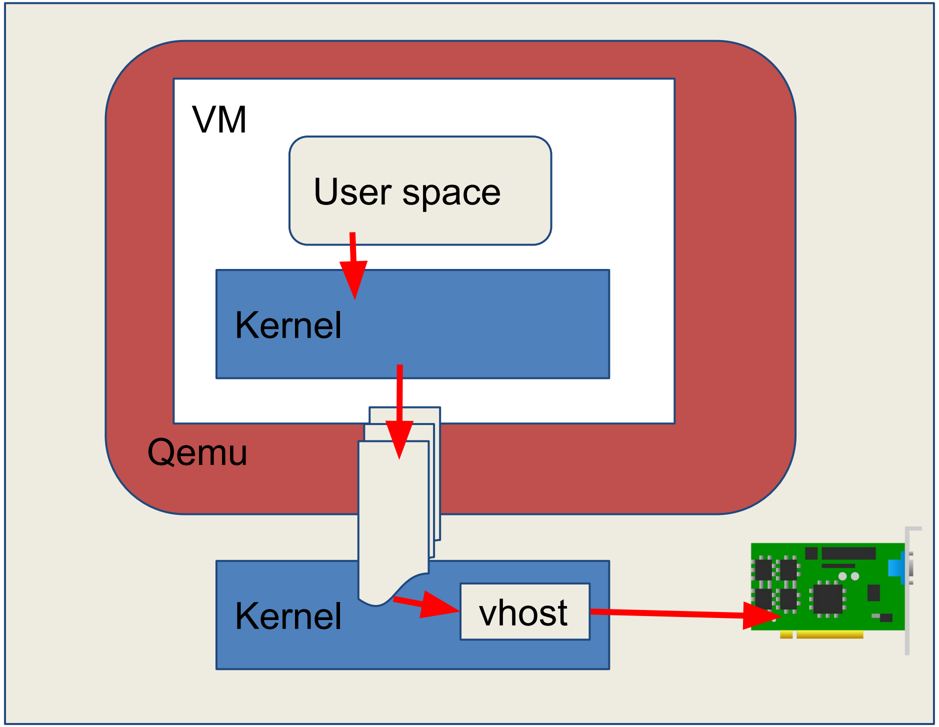
Pass-through networking
SR-IOV (PCIe pass-through)

Networking - virtio

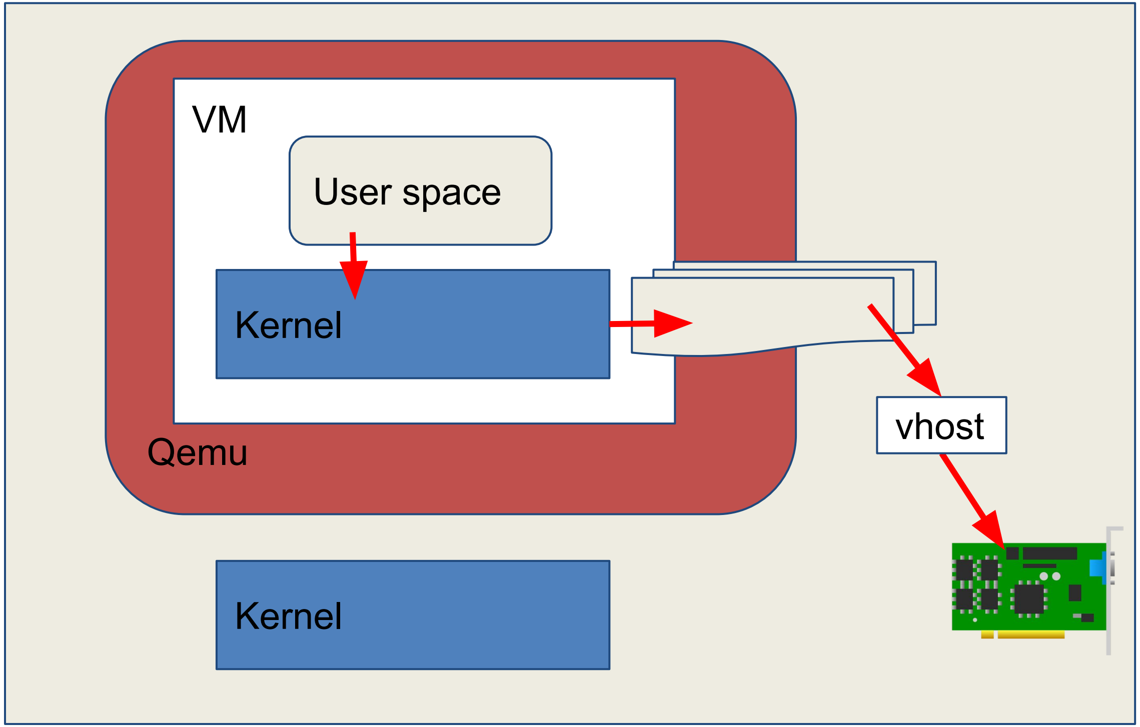


StorPool
DISTRIBUTED STORAGE

Networking - vhost

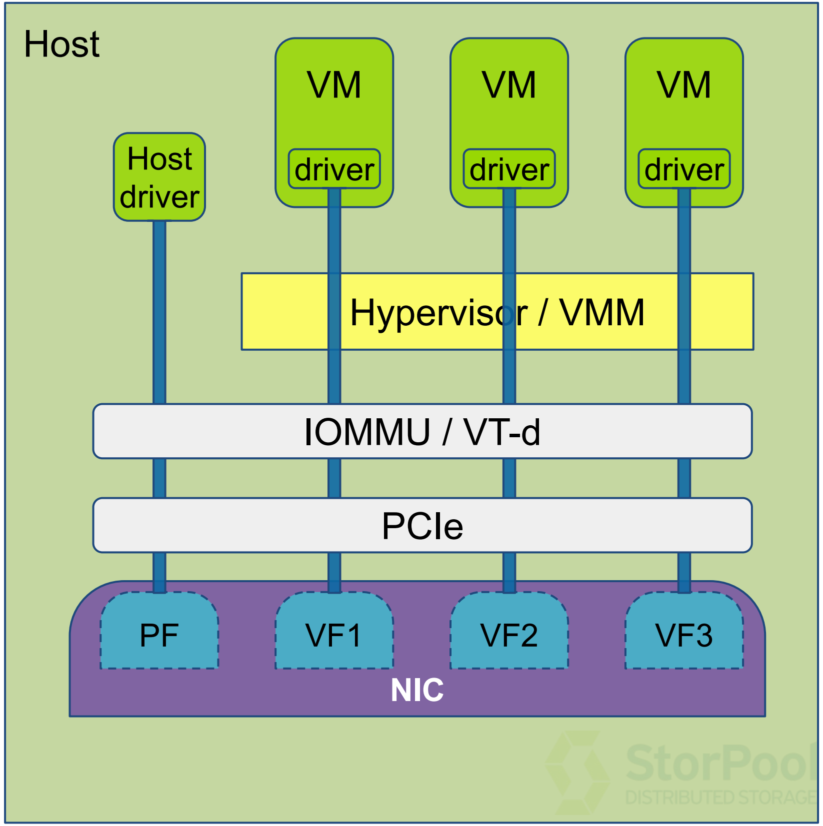


Networking - vhost-user



Networking - PCI Passthrough and SR-IOV

- Direct exclusive access to the PCI device
- SR-IOV - one physical device appears as multiple virtual functions (VF)
- Allows different VMs to share a single PCIe hardware



Discussion

Agenda

- Hardware
- Compute - CPU & Memory
- Networking
- Storage

StorPool
DISTRIBUTED STORAGE

Storage - virtualization

Virtualized

cache=none -- direct IO, bypass host buffer cache

io=native -- use Linux Native AIO, not POSIX AIO (threads)

virtio-blk vs virtio-scsi

virtio-scsi multiqueue

iothread

vs. Full bypass

SR-IOV for NVMe devices

StorPool
DISTRIBUTED STORAGE

Storage - vhost

Virtualized with qemu bypass

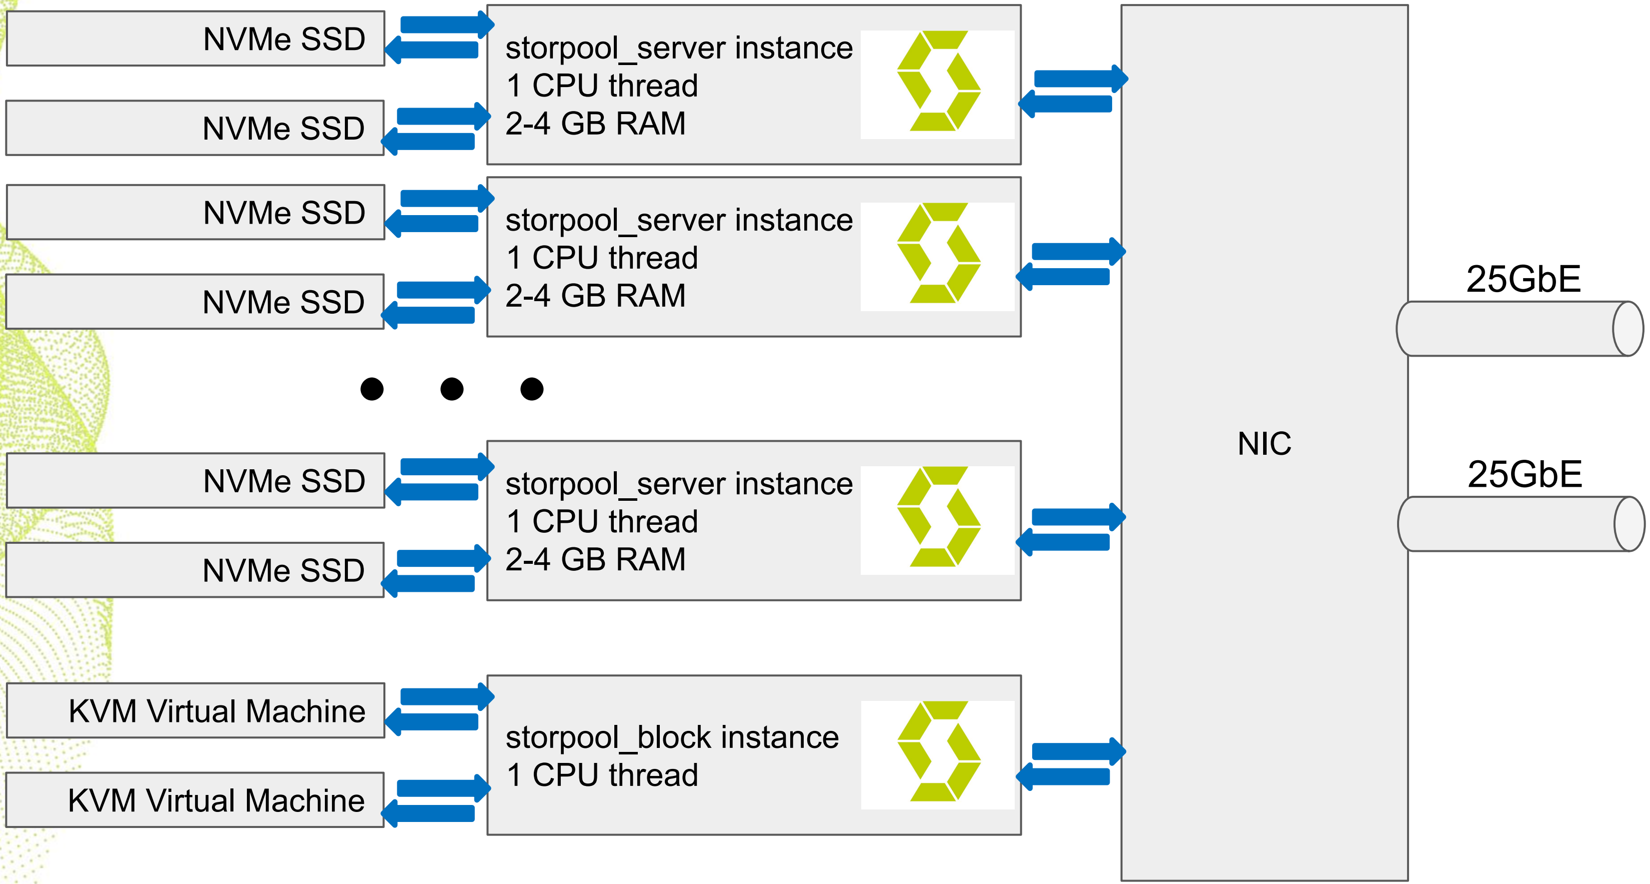
vhost

before:

guest kernel -> host kernel -> qemu -> host kernel -> storage system

after:

guest kernel -> storage system



- Highly scalable and efficient architecture
- Scales up in each storage node & out with multiple nodes

StorPool DISTRIBUTED STORAGE

Storage benchmarks

Beware: lots of snake oil out there!

- performance numbers from hardware configurations totally unlike what you'd use in production
- synthetic tests with high iodepth - 10 nodes, 10 workloads * iodepth 256 each. (because why not)
- testing with ramdisk backend

- synthetic workloads don't approximate real world (example)
